Lab:1

Install Dev C++/VS Code and run some basic programs 2. Make a GitHub account and make a repository for the lab and upload lab-01

Objective of the Lab

The objective of this lab was to become familiar with programming tools and version control. In this lab we installed a C++ development environment, created and executed basic programs, and learned how to use GitHub to upload our lab work. We also created a tutorial video explaining the steps.

Software Used

1. **Dev C++ / VS Code** – for writing and running C++ programs.
 2. **GitHub** – for storing and sharing the lab repository online.
-

Task 1: Installing Dev C++ / VS Code and Running Basic Programs

First, we installed **Dev C++ / Visual Studio Code** on the computer.

Steps:

1. Downloaded the software from the official website.
2. Installed it on the computer.
3. Opened the IDE (Integrated Development Environment).

4. Created a new C++ file.
5. Wrote a simple C++ program.

Example Program

```
#include <iostream>
using namespace std;

int main()
{
    cout << "Hello World!" << endl;
    return 0;
}
```

Output

Hello World!

This program demonstrates the basic structure of a C++ program and prints a message on the screen.

Task 2: Creating a GitHub Repository

We created a GitHub account and uploaded the lab files.

Steps:

1. Opened **github.com**.
2. Created a new account.
3. Clicked **New Repository**.
4. Named the repository **Programming-Lab**.
5. Uploaded the **Lab-01 files**.
6. Saved the repository online.

GitHub helps in storing code and sharing it with others.

In this lab we learned how to install a programming environment, write and execute a basic C++ program, and upload our work to GitHub. We also practiced explaining the process by creating a tutorial video. This lab helped us understand the basic tools required for programming.
